                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DEVELOPMENTAL STAGE: FIRST STRONGLY EXPRESSED IN RESTRICTED DOMAINS AT 8.5 DAYS POST COITUS (DPC) WHERE IT IS HIGHEST IN THE TAIL BUD. AT 10.5 DPC, EXPRESSED IN THE BRANCHIAL ARCHES, LIMB BUD, TAIL BUD AND POSTERIOR DORSAL NEURAL TUBE. LATER, EXPRESSED IN TERMINALLY-DIFFERENTIATED ODONTOBLASTS, THE NASAL EPITHELIUM, RETINA AND SPECIFIC REGIONS OF THE BRAIN. SIMILARITY: BELONGS TO THE TGF-BETA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PLAY CRITICAL ROLES IN PATTERNING BOTH MESODERMAL AND NEURAL TISSUES AND IN ESTABLISHING THE SKELETAL PATTERN.
SUBUNIT: HOMODIMER; DISULFIDE-LINKED (BY SIMILARITY).
SUBCELLULAR LOCATION: Secreted (Probable).
TISSUE SPECIFICITY: HIGHLY EXPRESSED IN THE DEVELOPING LIMB BUD, INITIALLY DETECTED IN THE DISTAL MESENCHYME, AND LATER LOCALIZING IN REGIONS AROUND THE DEVELOPING BONES. IS ALSO EXPRESSED IN ADULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AF100906; AAC72853.1;

The DVR-1 (Vg1) transcript of zebrafish is maternally supplied and the distributed throughout the embryo.";

Dev. Biol. 159:418-426 (1993).

C -!- FUNCTION: SERVES TO FACILITATE THE DIFFERENTIATION OF EITHER MESODERM OR ENDODERM EITHER AS A COFACTOR IN AN INSTRUCTIVE SIGNAL OR BY PROVIDING PERMISSIVE ENVIRONMENT.

C -!- SUBUNIT: HOMODIMER (PROBABLE).

C -!- TISSUE SPECIFICITY: ABUNDANT IN OVARIES AND EGGS, AND EQUALLY DISTRIBUTED AMONG ALL BLASTOMERES.

C -!- DEVELOPMENTAL STAGE: CONCENTRATED IN THE STREAMING CYTOPLASM IN JUST-FERTILIZED EGGS. EVENLY PARTITIONED DURING CLEAVAGE AMONG ALL GLASTOMERES. ABSENT IN THE YOLK CELL DURING CLEAVAGE, BLASTULA AND GRASTRULA STAGES. DISTRIBUTED HOMOGENEOUSLY AMONG ALL CELLS OF THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to muteins of a chain of a protein which, when in the form of a homodimer, has antagonistic or partial agonistic activity, and where the mutation results in the protein binding with low affinity to its receptor. The protein is a member of the transforming growth factor beta (TGFbeta) superfamily. The mutant sequences of the invention can be used in the treatment of diseases associated with the overexpression of TGFbeta family proteins, including ectopic bone formation, psoriasis, muscular atrophy, scar formation, fibrosis and cirrhosis. The present sequence is the human GDF8 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New mutein of transforming growth useful for treating or preventing for receptor binding -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ś
This is the amino acid sequence of the C-terminal portion of mouse C growth differentiation factor-8 (GDF-8), a novel member of the C transforming growth factor-beta superfamily that appears to relate C to various cell proliferative disorders, especially those involving C muscle, nerve and adipose tissue. The sequence was deduced from a C partial genomic clone (see AAV45809). A full-length sequence (see C AAW30689) has been deduced from a cDNA clone (see AAV42113). The C invention provides novel mammalian and avian GDF-8 proteins (see C GDF-8 expression is disrupted or interfered with. Also claimed C are: (1) chicken or turkey eggs or meat, beef, milk, pork and lamb C from these animals; (2) method for increasing muscle mass in contained to GDF-8; (3)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Best

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       inhibiting the action of GDF-8 by treating foetal or adult muscle or progenitor cells with a GDF-8 inhibitor; (4) isolated nucleic acid encoding a GDF-8 protein truncated by loss of the C-terminal cative fragment. The transgenic animals have increased muscle mass cand for poultry reduced cholesterol contents. Method (3) is used to treat muscle wasting or neuromuscular diseases, muscular atrophy cand aging, particularly muscular dystrophy, spinal cord or traumatic injuries, congestive or obstructive lung disease, AIDS and cachexia. Method (4) is used to treat cancer of muscle, connective tissue and bone, or obesity. Also (not claimed) GDF-8 can be used to maintain myoblasts intended for transplanting or to improve efficiency of fusion. Ab can be used to detect and cansofor immunotherapy and in vivo imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

proteory protein. The processing sites.

C proteolytic processing sites.

C proteolytic processing sites.

C cleavage of the precursor at the second of these sites would general cleavage of the precursor at the second of these sites would general cleavage of the precursor at the second of these sites would general cleavage of the precursor at the second of these sites would general cleavage of the precursor at the second of the second clear weight of 12,400.

C animals and forms of animal feed that can inhibit/reduce production of comparison of commercial interest.

C GDF-8 are of commercial interest.

C GDF-8 expression may also have a role in the therapy of abnormal growth of muscle, bone or adipose tissue. A GDF-8 monoclonal antibody, GDF-8 entisense molecule or dominant negative polypeptide could be used with cotal or adult muscle cells, bone cells or progenitor cells. These clears or adult muscle cells, bone cells or progenitor cells. These can be administered to a patient suffering from a disorder such as muscle wasting disease, neuro muscular disorder, muscle atrophy, osteoporosis, bone degenerative diseases, obesity or other adipocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                & XOOOOOOOOOOOOOOOOOO

                                                                                                                                                                                                                                                                                                                                trauma,
                                                                                                                                                                                                        ing sequences and proteins. The present sequence is a GDF-8 protein, ch was isolated in the present invention. GDF-8 is useful for treating rodegenerative diseases (e.g. amyotrophic lateral sclerosis and cular dystrophy), musculodegenerative diseases or in tissue repair due trauma, obesity and disorders related to abnormal proliferation of pocytes. GDF-8 is also useful for treating malignancies of the various an systems, particularly cells in muscle or adipose tissues and in a therapy for the treatment of cell proliferative or immunological sases mediated by GDF-8. In addition, GDF-8 is also useful for iting muscle wasting disease, neuromuscular disorder, spinal cord iry, traumatic injury, congestive obstructive pulmonary disease pD), AIDS or cachexia.

GDF-8 is useful for treating neurodegenerative diseases (e.g. amyotrophic lateral sclerosis and muscular dystrophy), musculodegenerative diseases or in tissue repair due to trauma, obesity and disorders related to abnormal proliferation of adipocytes. GDF-8 is also useful for treating malignancies of the various organ systems, particularly cells in muscle or adipose tissues and in gene therapy for the treatment of cell proliferative or immunological diseases mediated by GDF-8. In addition, GDF-8 is also useful for treating muscle wasting disease, neuromuscular disorder, spinal cord injury, traumatic injury, congestive obstructive pulmonary disease (COPD), AIDS or cachexia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence

```
cc which consists of the C-terminal 160 amino acids of human growth cc differentiation factor 8 (GDF-8, see AAF20131) with residues 16-36 cc substituted by the promiscuous tetanus toxin T-cell epitope P30 (see CC AAB20144) and residues 37-51 substituted by tetanus toxin T-cell epitope P2 (see AAB20143). It is an object of the invention to comprise comparison of GDF-8 in order to increase the muscle growth crate of farm animals. The vaccines (see AAB20145-53) are capable of breaking autotolerance against autologous GDF-8. They comprise cc the C-terminal portion of human GDF-8 in which a portion of the che protein. Nucleic acids encoding the GDF-8 variants can be used cfor genetic immunisation of the animals. Down-regulation of GDF-8 activity can increase muscle mass by up to at least 45% in cattle, pigs and poultry used for meat production, reducing the need for antibiotic feed-additives. Anti-GDF8 vaccines can be used to treat human disease such as cancer cachexia where muscle atrophy is gronounced and for patients suffering from acute and chronic heart cfailure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Increasing the muscle mass of animals used in meat production by regulating growth differentiation factor 8 (GDF-8) activity in the animal through induction of anti-GDF-8 antibody production -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2001-112680/12

GDF-8 is a GDF-8 protein, neurodegenerative diseases (e.g. amyotrophic lateral sclerosis and muscular dystrophy), musculodegenerative diseases or in tissue repair due to trauma, obesity and disorders related to abnormal proliferation of adipocytes. GDF-8 is also useful for treating malignancies of the various organ systems, particularly cells in muscle or adipose tissues and in gene therapy for the treatment of cell proliferative or immunological diseases mediated by GDF-8. In addition, GDF-8 is also useful for treating muscle wasting disease, neuromuscular disorder, spinal cord injury, traumatic injury, congestive obstructive pulmonary disease. (COPD), AIDS or cachexia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of AutoVac construct GDF-8 dimer comprising 2 copies of the 109-amino acid C-terminal region of human growth differentiation factor 8 (GDF-8, see AAF20141) covalently connected through the P2 and P30 T-cell epitopes (see AAB20143-44) of tetanus toxin. It is an object of the invention to produce a recombinant therapeutic vaccine that is capable of effecting down-regulation of GDF-8 in order to increase the muscle growth rate of farm animals. The vaccines (see AAB20145-53) are capable of breaking autotolerance against autologous GDF-8. They comprise the C-terminal portion of human GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope such as P30, with minimal disturbance of the authentic 3-dimensional structure of the protein. Nucleic acids encoding the GDF-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8 activity can increase muscle mass by up to at least 45% in cattle, pigs and poultry used for meat production, reducing the need for antibiotic feed-additives. Anti-GDF8 vaccines can be used to treat human diseases such as cancer cachexia where muscle atrophy is pronounced and for patients suffering from acute and chronic heart
                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            factor (GDF) receptor, specifically a myostatin receptor, or its functional peptide portion. Also described is a method of modulating an effect of myostatin on a cell by contacting the cell with an agent that affects myostatin signal transduction in the cell. The method and the receptor are useful for ameliorating the severity of a pathological condition characterised by an abnormal amount, development or metabolic activity of muscle or adipose tissue in a subject, particularly a wasting disorder (e.g. cachexia, anorexia, muscular dystrophy or neuromuscular disease) or a metabolic disorder (e.g. obesity or type II diabetes). The present sequence represents the amino acid sequence of chicken
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 200

GDF-8 expression is disrupted or interfered with. Also claimed care: (1) chicken or turkey eggs or meat, beef, milk, pork and lamb from these animals; (2) method for increasing muscle mass in canimals by administering an antibody (Ab) that binds to GDF-8; (3) inhibiting the action of GDF-8 by treating foetal or adult muscle or progenitor cells with a GDF-8 inhibitor; (4) isolated nucleic acid encoding a GDF-8 protein truncated by loss of the C-terminal active fragment. The transgenic animals have increased muscle mass and for poultry reduced cholesterol contents. Method (3) is used to treat muscle wasting or neuromuscular diseases, muscular atrophy and aging, particularly muscular dystrophy, spinal cord or traumatic injuries, congestive or obstructive lung disease, AIDS and cachexia. Method (4) is used to treat cancer of muscle, connective tissue and bone, or obesity. Also (not claimed) GDF-8 can be used to maintain myoblasts intended for transplanting or to improve efficiency of fusion. Ab can be used to detect and quantify GDF-8 (particularly in muscle, for diagnosis or monitoring), also for immunotherapy and in vivo imaging.

This is the amino acid sequence of porcine growth differentiation factor-8 (GDF-8), a novel member of the transforming growth factor-8 (beta superfamily that appears to relate to various cell proliferative disorders, especially those involving muscle, nerve and adipose tissue. The sequence was deduced from a cDNA clone (see AAV45822) isolated from a skeletal muscle cDNA library. The invention provides novel mammalian and avian GDF-8 proteins (see AAW69883-92). A transgenic non-human animal is claimed in which GDF-8 expression is disrupted or interfered with. Also claimed are: (1) chicken or turkey eggs or meat, beef, milk, pork and lamb from these animals; (2) method for increasing muscle mass in animals by administering an antibody (Ab) that binds to GDF-8; (3) inhibiting the action of GDF-8 by treating foetal or adult muscle or progenitor cells with a GDF-8 inhibitor; (4) isolated nucleic acid encoding a GDF-9 protein truncated by loss of the C-terminal active fragment. The transgenic animals have increased muscle mass and for poultry reduced cholesterol contents. Method (3) is used to treat muscle wasting or neuromuscular diseases, muscular atrophy and cachexia. Method (4) is used to treat cancer of muscle, connective tissue and bone, or obstructive lung disease, AIDS and cachexia. Method (4) is used to treat cancer of muscle, can be used to maintain myoblastis intended for transplanting or to improve efficiency of fusion. Ab can be used to detect and quantify GDF-8 (particularly in muscle, for diagnosis or monitoring), also industry and in vivo imaging.

Sequence 29, Application US/09252149B

Patent No. 6369201

GENERAL INFORMATION:

APPLICANT: Barker, Christopher A.

APPLICANT: Morsey, Mohamad

TITLE OF INVENTION: IMMUNOLOGICAL METHODS TO MODULAR MYOSTATIN IN

TITLE OF INVENTION: VERTEBRATE SUBJECTS

FILE REFERENCE: 9001-0042

CURRENT APPLICATION NUMBER: US/09/252,149B

CURRENT APPLICATION NUMBER: 60/075,213

PRIOR APPLICATION NUMBER: 60/075,213

PRIOR APPLICATION NUMBER: 60/075,213

PRIOR APPLICATION NUMBER: 60/075,213

PRIOR FILING DATE: 1998-02-19

NUMBER OF SEQ ID NOS: 39

SOPTWARE: Patentin Ver. 2.0

Patent No. 6465239

GENERAL INFORMATION:
APPLICANT: Lee, Se-Jin
APPLICANT: Lee, Se-Jin
TITLE OF INVENTION: ACID AND POLYPEPTIDES FROM AQUATIC SPECIES AND NON-HUMAN
TITLE OF INVENTION: ACID AND POLYPEPTIDES FROM AQUATIC SPECIES PILE REFERENCE: JHU1120-9

CURRENT FILING DATE: 1999-08-19

EARLIER APPLICATION NUMBER: US/09/378,238

CURRENT FILING DATE: 1997-02-05

EARLIER FILING DATE: 1997-02-05

EARLIER APPLICATION NUMBER: 08/795,071

EARLIER APPLICATION NUMBER: 08/795,071
